### REC\_DS using C\_Week 5\_MCQ

Attempt : 1  
Total Mark : 15  
Marks Obtained : 14

#### Section 1 : MCQ

1. Find the preorder traversal of the given binary search tree.

**Answer**

9, 2, 1, 6, 4, 7, 10, 14

**Status : Correct**

**Marks : 1/1**

2. Find the in-order traversal of the given binary search tree.

**Answer**

1, 2, 4, 13, 14, 18

**Status :** Correct

**Marks :** 1/1

3. While inserting the elements 71, 65, 84, 69, 67, 83 in an empty binary search tree (BST) in the sequence shown, the element in the lowest level is \_\_\_\_\_.

**Answer**

67

**Status :** Correct

**Marks :** 1/1

4. Find the post-order traversal of the given binary search tree.

**Answer**

10, 17, 18, 20, 15, 32, 21

**Status :** Wrong

**Marks :** 0/1

5. Which of the following is the correct post-order traversal of a binary search tree with nodes: 50, 30, 20, 55, 32, 52, 57?

**Answer**

20, 32, 30, 52, 57, 55, 50

**Status :** Correct

**Marks :** 1/1

6. Which of the following is the correct in-order traversal of a binary search tree with nodes: 9, 3, 5, 11, 8, 4, 2?

**Answer**

2, 3, 4, 5, 8, 9, 11

**Status :** Correct

**Marks :** 1/1

7. The preorder traversal of a binary search tree is 15, 10, 12, 11, 20, 18,

16,19. Which one of the following is the postorder traversal of the tree?

**Answer**

11, 12, 10, 16, 19, 18, 20, 15

**Status : Correct**

**Marks : 1/1**

8. Find the pre-order traversal of the given binary search tree.

**Answer**

13, 2, 1, 4, 14, 18

**Status : Correct**

**Marks : 1/1**

9. Which of the following is a valid preorder traversal of the binary search tree with nodes: 18, 28, 12, 11, 16, 14, 17?

**Answer**

18, 12, 11, 16, 14, 17, 28

**Status : Correct**

**Marks : 1/1**

10. While inserting the elements 5, 4, 2, 8, 7, 10, 12 in a binary search tree, the element at the lowest level is \_\_\_\_\_.

**Answer**

12

**Status : Correct**

**Marks : 1/1**

11. Find the postorder traversal of the given binary search tree.

**Answer**

1, 4, 2, 18, 14, 13

**Status :** Correct

**Marks :** 1/1

12. Which of the following is the correct pre-order traversal of a binary search tree with nodes: 50, 30, 20, 55, 32, 52, 57?

**Answer**

50, 30, 20, 32, 55, 52, 57

**Status :** Correct

**Marks :** 1/1

13. In a binary search tree with nodes 18, 28, 12, 11, 16, 14, 17, what is the value of the left child of the node 16?

**Answer**

14

**Status :** Correct

**Marks :** 1/1

14. Which of the following operations can be used to traverse a Binary Search Tree (BST) in ascending order?

**Answer**

Inorder traversal

**Status :** Correct

**Marks :** 1/1

15. How many distinct binary search trees can be created out of 4 distinct keys?

**Answer**

14

**Status :** Correct

**Marks :** 1/1

### REC\_DS using C\_Week 5\_COD\_Question 1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

John is learning about Binary Search Trees (BST) in his computer science class. He wants to create a program that allows users to delete a node with a given value from a BST and print the remaining nodes using an in-order traversal.

Implement a function to help him delete a node with a given value from a BST.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of nodes in the BST.

The second line consists of N space-separated integers, representing the values of the BST nodes.

The third line consists of an integer V, which is the value to delete from the BST.

### **Output Format**

The output prints the space-separated values in the BST in an in-order traversal, after the deletion of the specified value.

If the specified value is not available in the tree, print the given input values in-order traversal.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5  
10 5 15 2 7  
15

Output: 2 5 7 10

### **Answer**

```
#include <stdio.h>
#include <stdlib.h>
```

```
struct TreeNode {
    int data;
    struct TreeNode* left;
    struct TreeNode* right;
};
```

```
struct TreeNode* createNode(int key) {
    struct TreeNode* newNode = (struct TreeNode*)malloc(sizeof(struct
TreeNode));
    newNode->data = key;
    newNode->left = newNode->right = NULL;
    return newNode;
}
```

```
struct TreeNode* insert(struct TreeNode* root, int key){
    if (root == NULL){
        struct TreeNode *newNode = (struct TreeNode*)malloc(sizeof(struct
TreeNode));
```

```

newNode->data = key;
newNode->left = NULL;
newNode->right = NULL;
return newNode;
} else if (key < root->data){
    root->left = insert(root->left, key);
} else if (key > root->data)
{
    root->right = insert(root->right, key);
}
return root;
}
struct TreeNode* findMin(struct TreeNode* root){
    while (root && root->left){
        root = root->left;
    }
    return root;
}
struct TreeNode* deleteNode(struct TreeNode* root, int key){
    if (root == NULL){
        return root;
    }
    if (key < root->data){
        root->left = deleteNode(root->left, key);
    } else if (key > root->data){
        root->right = deleteNode(root->right, key);
    } else{
        if (root->left == NULL){
            struct TreeNode* temp = root->right;
            free(root);
            return temp;} else if (root->right == NULL)
        {

            struct TreeNode* temp = root->left;
            free(root);
            return temp;
        }
        struct TreeNode* temp = findMin(root->right);
        root->data = temp->data;

```

```

    root->right = deleteNode(root->right, temp->data);
}
return root;
}
void inorderTraversal(struct TreeNode* root)
{
    if (root != NULL)
    {
        inorderTraversal(root->left);
        printf("%d\t", root->data);
        inorderTraversal(root->right);
    }
}
int main()
{
    int N, rootValue, V;
    scanf("%d", &N);
    struct TreeNode* root = NULL;
    for (int i = 0; i < N; i++) {
        int key;
        scanf("%d", &key);
        if (i == 0) rootValue = key;
        root = insert(root, key);
    }
    scanf("%d", &V);
    root = deleteNode(root, V);
    inorderTraversal(root);
    return 0;
}

```

#### Section 1 : Coding

##### 1. Problem Statement

Mike is learning about Binary Search Trees (BSTs) and wants to implement various operations on them. He wants to write a basic program for creating a BST, inserting nodes, and printing the tree in the pre-order traversal.

Write a program to help him solve this program.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of values to insert into the BST.

The second line consists of N space-separated integers, representing the values to insert into the BST.

##### ***Output Format***

The output prints the space-separated values of the BST in the pre-order traversal.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

3 1 5 2 4

Output: 3 1 2 5 4

### **Answer**

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
struct Node {  
    int data;  
    struct Node* left;  
    struct Node* right;  
};
```

```
struct Node* createNode(int value) {  
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));  
    newNode->data = value;  
    newNode->left = newNode->right = NULL;  
    return newNode;  
}
```

```
struct Node* insert(struct Node* root, int value) {  
    if (root == NULL)  
    {  
        return createNode(value);  
    }  
    if (value < root->data)
```

```
{  
    root->left = insert(root->left, value);  
} else  
{  
    root->right = insert(root->right, value);
```

```
}  
    return root;  
}
```

```
void printPreorder(struct Node* node)
```

```
{  
    if (node == NULL)  
        return;  
    printf("%d ", node->data);  
    printPreorder(node->left);  
    printPreorder(node->right);  
}
```

```
int main() {  
    struct Node* root = NULL;
```

```
    int n;  
    scanf("%d", &n);
```

```
    for (int i = 0; i < n; i++) {  
        int value;  
        scanf("%d", &value);  
        root = insert(root, value);  
    }

### REC\_DS using C\_Week 5\_COD\_Question 3

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

You are required to implement basic operations on a Binary Search Tree (BST), like insertion and searching.

Insertion: Given a list of integers, construct a Binary Search Tree by repeatedly inserting each integer into the tree according to the rules of a BST.

Searching: Given an integer, search for its presence in the constructed Binary Search Tree. Print whether the integer is found or not.

Write a program to calculate this efficiently.

##### ***Input Format***

The first line of input consists of an integer n, representing the number of nodes

in the binary search tree.

The second line consists of the values of the nodes, separated by space as integers.

The third line consists of an integer representing, the value that is to be searched.

### **Output Format**

The output prints, "Value <value> is found in the tree." if the given value is present, otherwise it prints: "Value <value> is not found in the tree."

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 7

8 3 10 1 6 14 23

6

Output: Value 6 is found in the tree.

### **Answer**

```
struct Node* insertNode(struct Node* root, int value)
{
    if (root == NULL) {
        return createNode(value);
    }
    if (value < root->data){
        root->left = insertNode(root->left, value);
    } else if (value > root->data){
        root->right = insertNode(root->right, value);
    }
    return root;
}

struct Node* searchNode(struct Node* root, int value) {
    if (root == NULL || root->data == value) {
        return root;
    }
    if (value < root->data) {
        return searchNode(root->left, value);
    } else {
```

```
        return searchNode(root->right, value);  
    }  
}
```

##### 1. Problem Statement

Kishore is studying data structures, and he is currently working on implementing a binary search tree (BST) and exploring its basic operations. He wants to practice creating a BST, inserting elements into it, and performing a specific operation, which is deleting the minimum element from the tree.

Write a program to help him perform the delete operation.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of elements Kishore wants to insert into the BST.

The second line consists of N space-separated integers, where each integer represents an element to be inserted into the BST.

### **Output Format**

The output prints the remaining elements of the BST in ascending order (in-order traversal) after deleting the minimum element.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 6

5 3 8 2 4 6

Output: 3 4 5 6 8

### **Answer**

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node *left, *right;
};
struct Node* newNode(int val) {
    struct Node* temp = (struct Node*)malloc(sizeof(struct Node));
    temp->data = val;
    temp->left = temp->right = NULL;
    return temp;
}
struct Node* insert(struct Node* root, int val) {
    if (root == NULL)
        return newNode(val);
    if (val < root->data)
        root->left = insert(root->left, val);
    else if (val > root->data)
        root->right = insert(root->right, val);
    return root;
}
struct Node* deleteMin(struct Node* root) {
    if (root == NULL)
        return NULL;
```

```

    if (root->left == NULL) {
        struct Node* rightChild = root->right;
        free(root);
        return rightChild;
    }
    root->left = deleteMin(root->left);
    return root;
}

void inorder(struct Node* root) {
    if (root == NULL)
        return;
    inorder(root->left);
    printf("%d ", root->data);
    inorder(root->right);
}

int main() {
    int N, i, val;
    scanf("%d", &N);
    struct Node* root = NULL;
    for (i = 0; i < N; i++) {
        scanf("%d", &val);
        root = insert(root, val);
    }
    root = deleteMin(root);
    inorder(root);
    printf("\n");
    return 0;
}

```

## 2. Problem Statement

Dhruv is working on a project where he needs to implement a Binary Search Tree (BST) data structure and perform various operations on it.

He wants to create a program that allows him to build a BST, traverse it in different orders (inorder, preorder, postorder), and exit the program when needed.

Help Dhruv by designing a program that fulfils his requirements.

### ***Input Format***

The first input consists of the choice.

If the choice is 1, enter the number of elements N and the elements inserted into the tree, separated by a space in a new line.

If the choice is 2, print the in-order traversal.

If the choice is 3, print the pre-order traversal.

If the choice is 4, print the post-order traversal.

If the choice is 5, exit.

### ***Output Format***

The output prints the results based on the choice.

For choice 1, print "BST with N nodes is ready to use" where N is the number of nodes inserted.

For choice 2, print the in-order traversal of the BST.

For choice 3, print the pre-order traversal of the BST.

For choice 4, print the post-order traversal of the BST.

For choice 5, the program exits.

If the choice is greater than 5, print "Wrong choice".

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 1

5

12 78 96 34 55

2  
3  
4  
5

Output: BST with 5 nodes is ready to use

BST Traversal in INORDER

12 34 55 78 96

BST Traversal in PREORDER

12 78 34 55 96

BST Traversal in POSTORDER

55 34 96 78 12

### **Answer**

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
// Define BST node structure
```

```
struct Node
```

```
{
```

```
    int data;
```

### 3. Problem Statement

Arun is working on a Binary Search Tree (BST) data structure. His goal is to implement a program that reads a series of integers and inserts them into a BST. Once the integers are inserted, he needs to add a given integer value to each node in the tree and find the maximum value in the BST.

Your task is to help Arun implement this program.

#### ***Input Format***

The first line of input consists of an integer N, representing the number of elements to be inserted into the BST.

The second line consists of N space-separated integers, each representing an element to be inserted into the BST.

The third line consists of an integer add, representing the value to be added to each node in the BST.

#### ***Output Format***

The output prints the maximum value in the BST after adding the add value.

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 5  
10 5 15 20 25  
5

Output: 30

#### ***Answer***

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node* left;
    struct Node* right;
```

```

};
struct Node* newNode(int data){
    struct Node* temp = (struct Node*)malloc(sizeof(struct Node));
    temp->data = data;
    temp->left = temp->right = NULL;
    return temp;
}
struct Node* insert(struct Node* root, int data) {
    if (root == NULL) return newNode(data);
    if (data < root->data)
        root->left = insert(root->left, data);
    else
        root->right = insert(root->right, data);
    return root;
}
void addToAllNodes(struct Node* root, int add) {
    if (root == NULL) return;
    root->data += add;
    addToAllNodes(root->left, add);
    addToAllNodes(root->right, add);
}
int findMax(struct Node* root) {
    if (root == NULL) return -1;
    while (root->right != NULL)
        root = root->right;
    return root->data;
}
int main() {
    int N, add, val;
    struct Node* root = NULL;
    scanf("%d", &N);
    for (int i = 0; i < N; i++) {
        scanf("%d", &val);
        root = insert(root, val);
    }
    scanf("%d", &add);
    addToAllNodes(root, add);
    int max = findMax(root);
    printf("%d\n", max);
    return 0;
}

```

#### Section 1 : Coding

##### 1. Problem Statement

Aishu is participating in a coding challenge where she needs to reconstruct a Binary Search Tree (BST) from given preorder traversal data and then print the in-order traversal of the reconstructed BST.

Since Aishu is just learning about tree data structures, she needs your help to write a program that does this efficiently.

##### ***Input Format***

The first line consists of an integer  $n$ , representing the number of nodes in the BST.

The second line of input contains  $n$  integers separated by spaces, which represent the preorder traversal of the BST.

### **Output Format**

The output displays n space-separated integers, representing the in-order traversal of the reconstructed BST.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 6

10 5 1 7 40 50

Output: 1 5 7 10 40 50

### **Answer**

```
#include <stdio.h>
#include <stdlib.h>
#include <limits.h>
struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};
struct Node* newNode(int data) {
    struct Node* temp = (struct Node*)malloc(sizeof(struct Node));
    temp->data = data;
    temp->left = temp->right = NULL;
    return temp;
}
struct Node* buildBST(int preorder[], int* index, int min, int max, int n) {
    if (*index >= n)
        return NULL;
    int key = preorder[*index];
    if (key < min || key > max)
        return NULL;
    struct Node* root = newNode(key);
    (*index)++;
    root->left = buildBST(preorder, index, min, key - 1, n);
    root->right = buildBST(preorder, index, key + 1, max, n);
    return root;
}
```

```

void inorderTraversal(struct Node* root)
{
    if (root == NULL)
        return;
    inorderTraversal(root->left);
    printf("%d ", root->data);
    inorderTraversal(root->right);
}
int main()
{
    int n;
    scanf("%d", &n);
    int preorder[n];
    for (int i = 0; i < n; i++)
    {
        scanf("%d", &preorder[i]);
    }
    int index = 0;
    struct Node* root = buildBST(preorder, &index, INT_MIN, INT_MAX, n);
    inorderTraversal(root);
    printf("\n");
    return 0;
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Viha, a software developer, is working on a project to automate searching for a target value in a Binary Search Tree (BST). She needs to create a program that takes an integer target value as input and determines if that value is present in the BST or not.

Write a program to assist Viha.

### **Input Format**

The first line of input consists of integers separated by spaces, which represent the elements to be inserted into the BST. The input is terminated by entering -1.

The second line consists of an integer target, which represents the target value

to be searched in the BST.

### **Output Format**

If the target value is found in the BST, print "[target] is found in the BST".

Else, print "[target] is not found in the BST"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5 3 7 1 4 6 8 -1

4

Output: 4 is found in the BST

### **Answer**

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};
struct Node* createNode(int value){
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}
struct Node* insert(struct Node* root, int value) {
    if (root == NULL){
        return createNode(value);
    }if (value < root->data)
    {
        root->left = insert(root->left, value);
    } else if (value > root->data) {
        root->right = insert(root->right, value);
    }
    return root;
}
```

```
int search(struct Node* root, int target)
```

```
{  
    if (root == NULL) return 0;  
    if (root->data == target) return 1;  
    if (target < root->data)  
        return search(root->left, target);  
    else  
        return search(root->right, target);  
}
```

```
int main()
```

```
{  
    struct Node* root = NULL;  
    int value;  
    while (1)  
    {  
        scanf("%d", &value);  
        if (value == -1) break;  
        root = insert(root, value);  
    }  
    int target;  
    scanf("%d", &target);  
    if (search(root, target)) {  
        printf("%d is found in the BST\n", target);  
    } else {  
        printf("%d is not found in the BST\n", target);  
    }  
    return 0;  
}
```

### 3. Problem Statement

Arun is exploring operations on binary search trees (BST). He wants to write a program with an unsorted distinct integer array that represents the BST keys and construct a height-balanced BST from it.

After constructing, he wants to perform the following operations that can alter the structure of the tree and traverse them using a level-order traversal:

InsertionDeletion

Your task is to assist Arun in completing the program without any errors.

### ***Input Format***

The first line of input consists of an integer N, representing the number of initial keys in the BST.

The second line consists of N space-separated integers, representing the initial keys.

The third line consists of an integer X, representing the new key to be inserted into the BST.

The fourth line consists of an integer Y, representing the key to be deleted from the BST.

### ***Output Format***

The first line of output prints "Initial BST: " followed by a space-separated list of keys in the initial BST after constructing it in level order traversal.

The second line prints "BST after inserting a new node X: " followed by a space-separated list of keys in the BST after inserting X n level order traversal.

The third line prints "BST after deleting node Y: " followed by a space-separated list of keys in the BST after deleting Y n level order traversal.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5  
25 14 56 28 12  
34  
12

Output: Initial BST: 25 14 56 12 28

BST after inserting a new node 34: 25 14 56 12 28 34

BST after deleting node 12: 25 14 56 28 34

**Answer**

```
#include <stdio.h>
#include <stdlib.h>
struct Node
{
    int data;
    struct Node *left, *right;
};
struct Node* newNode(int val) {
    struct Node* node = (struct Node*)malloc(sizeof(struct Node));
    node->data = val;

#### 4. Problem Statement

Yogi is working on a program to manage a binary search tree (BST) containing integer values. He wants to implement a function that removes nodes from the tree that fall outside a specified range defined by a minimum and maximum value.

Help Yogi by writing a function that achieves this.

#### **Input Format**

The first line of input consists of an integer N, representing the number of elements to be inserted into the BST.

The second line consists of N space-separated integers, representing the

elements to be inserted into the BST.

The third line consists of two space-separated integers min and max, representing the minimum value and the maximum value of the range.

### ***Output Format***

The output prints the remaining elements of the BST in an in-order traversal, after removing nodes that fall outside the specified range.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5  
10 5 15 20 12  
5 15

Output: 5 10 12 15

### ***Answer***

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node *left, *right;
};
struct Node* newNode(int val) {
    struct Node* node = (struct Node*)malloc(sizeof(struct Node));
    node->data = val;
    node->left = node->right = NULL;
    return node;
}
struct Node* insert(struct Node* root, int val) {
    if (root == NULL)
        return newNode(val);
    if (val < root->data)
        root->left = insert(root->left, val);
    else if (val > root->data)
        root->right = insert(root->right, val);
    return root;
}
```

```

struct Node* trimBST(struct Node* root, int min, int max) {
    if (root == NULL)
        return NULL;
    root->left = trimBST(root->left, min, max);
    root->right = trimBST(root->right, min, max);
    if (root->data < min) {
        struct Node* rightSubtree = root->right;
        free(root);
        return rightSubtree;
    } if (root->data > max) {
        struct Node* leftSubtree = root->left;
        free(root);
        return leftSubtree;
    }
    return root;
}

void inorder(struct Node* root){
    if (root == NULL) return;
    inorder(root->left);
    printf("%d ", root->data);
    inorder(root->right);
}

int main() {
    int N, min, max;
    scanf("%d", &N);
    struct Node* root = NULL;
    for (int i = 0; i < N; i++) {
        int val;
        scanf("%d", &val);
        root = insert(root, val);
    }
    scanf("%d %d", &min, &max);
    root = trimBST(root, min, max);
    inorder(root);
    printf("\n");
    return 0;
}

```

**Status :** Partially correct

**Marks :** 7.5/10

## 5. Problem Statement

Joseph, a computer science student, is interested in understanding binary search trees (BST) and their node arrangements. He wants to create a program to explore BSTs by inserting elements into a tree and displaying the nodes using post-order traversal of the tree.

Write a program to help Joseph implement the program.

### ***Input Format***

The first line of input consists of an integer N, representing the number of elements to insert into the BST.

The second line consists of N space-separated integers data, which is the data to be inserted into the BST.

### ***Output Format***

The output prints N space-separated integer values after the post-order traversal.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 4  
10 15 5 3  
Output: 3 5 15 10

### ***Answer***

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node *left, *right;
};
struct Node* newNode(int val) {
    struct Node* node = (struct Node*)malloc(sizeof(struct Node));
    node->data = val;
    node->left = node->right = NULL;
    return node;
}
```

```

}
struct Node* insert(struct Node* root, int val) {
    if (root == NULL)
        return newNode(val);
    if (val < root->data)
        root->left = insert(root->left, val);
    else if (val > root->data)
        root->right = insert(root->right, val);
    return root;
}
struct Node* trimBST(struct Node* root, int min, int max) {
    if (root == NULL)
        return NULL;
    root->left = trimBST(root->left, min, max);
    root->right = trimBST(root->right, min, max);
    if (root->data < min) {
        struct Node* rightSubtree = root->right;
        free(root);
        return rightSubtree;
    } if (root->data > max) {
        struct Node* leftSubtree = root->left;
        free(root);
        return leftSubtree;
    }
    return root;
}
void inorder(struct Node* root) {
    if (root == NULL) return;
    inorder(root->left);
    printf("%d ", root->data);
    inorder(root->right);
}
int main() {

```

```

    int N, min, max;
    scanf("%d", &N);
    struct Node* root = NULL;

```

```

    for (int i = 0; i < N; i++)
    {

```

```
int val;
scanf("%d", &val);
root = insert(root, val);

}

scanf("%d %d", &min, &max);

root = trimBST(root, min, max);

inorder(root);
printf("\n");

return 0;

}
```
